Integrated Innovation:

Microsoft Dynamics GP and the Microsoft Office System

BENEFITS

Search in Microsoft Dynamics GP

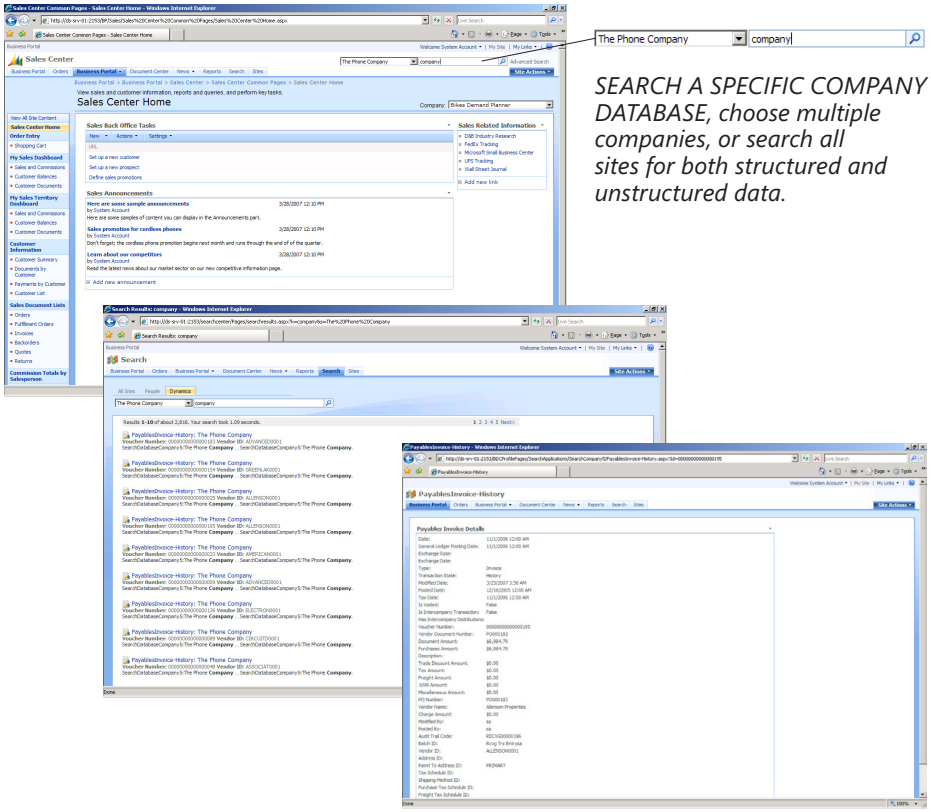
When Microsoft Dynamics™ GP is deployed with Microsoft® Office SharePoint® Server 2007, you can configure your systems to enable people to efficiently find critical business information, whether it's located within structured databases or unstructured repositories. Enhanced search capabilities empower your people to make the fast, informed, and trusted decisions that drive your business forward.

Increase access to information. Initiate searches from within Microsoft Dynamics GP, within Microsoft Business Portal, your Office SharePoint sites, or from any workstation desktop application—all while maintainging one version of the truth.

Find just the information you need. Register the applications you want to search in the Business Data Catalog provided with Office SharePoint Server 2007.

Increase search options and save time. Choose whether to search structured data sources, unstructured data sources, or both when you initiate the search. Searches can be set up and filtered using a straightforward wizard that makes it easy to define what data is searchable, and for whom.

Increase security. Access privileges are honored each time a search is initiated. A search returns summary information of all documents that match search criteria, but users can view only the information they have been authorized to access. When a Microsoft Dynamics GP summary result is selected, a profile page of the record opens, displaying details.



SEARCH A SPECIFIC COMPANY DATABASE, choose multiple companies, or search all sites for both structured and unstructured data.

USERS WITH APPROPRIATE ACCESS can drill into summary returned data.
