

SPAM Prevention

Today's profit-driven spammers are targeting exposed enterprises, resulting in lost user productivity, potential legal liability, and increased burden on IT staff, infrastructure and budget. The unnecessary IT costs of managing the spam problem often include overtaxed mail server CPUs, storage, bandwidth, and IT administrator time. To stay ahead of spammers, you need a more effective solution to compensate for the growing volume of spam. This is where our Isis SPAM Prevention Service comes in...

As a preemptive email security service that sits between the Internet and your email gateway, the Isis SPAM Prevention Services (ISPS) prevents email threats from ever reaching your network. ISPS uses a nationally recognized leading MSP to effectively stop spam, phishing, viruses, directory harvest attacks and other email threats through its patented, multi-layer technology. No other vendor provides such wide scope and in-depth protection from email intrusions.

Practically all organizations have deployed messaging and view it as a primary corporate application. Because uninterrupted delivery of our customers' email is of paramount importance, our solution is designed to improve the manageability, security, and resilience of this mission critical corporate function. Isis SPAM Prevention Services provides the following service level commitments:

- ▲ **Network Uptime:** Network availability is key to ensuring consistent email operation. ISPS guarantees 100% network uptime.
- ▲ **Resilient Email Delivery:** A company's email servers can become unavailable for many reasons - both planned and unplanned. In the event a company's email servers become unreachable, our Delivery Manager dynamically queues inbound email until the problem is resolved. Queued email is delivered at a rate consistent with the message infrastructure's ability to accept it. Because corporate email systems are constantly being upgraded, tuned, streamlined, or otherwise undergoing some kind of maintenance, this service is included as a standard feature – not at extra cost.
- ▲ **3X Virus Protection:** Our service scans inbound email using three anti-virus engines: McAfee, SOPHOS, and FPROT. The system checks for new virus definitions every 10 minutes, 24/7. This leaves your company's IT staff free to focus their attention on other virus entry points, confident that our service has already removed all known viruses from the inbound message stream.
- ▲ **Guaranteed SPAM Filtering:** Our advanced screening technology provides spam capture rates at better than 97% with falsely blocked messages occurring less than once per 10,000. More importantly, should such a "false positive" occur, our proactive Held Mail Report makes the issue known and correctable quickly and easily.

Contact Isis About Our **SPAM Prevention Service Today!**

- ▲ **Broad Product Coverage:** We provide SPAM and Virus Filtering for Microsoft Exchange, Group Wise, Notes/Domino, Oracle, Sendmail, and Linux/Unix.
- ▲ **SPAM:** Our SPAM Trap safely removes over 97% of all SPAM and malicious content from your inbound message stream by using all spam identification techniques. To keep up with spammers, our SPAM Lab operates around the clock adding new rules every 2-3 minutes, so your protection works like you do – every day!
- ▲ **Anti-Virus:** At no additional cost, we further cleanse the email stream of worms, viruses, and other protocol-based vulnerabilities using three anti-virus engines and proprietary detection systems. Anti-virus signatures are updated in real-time and require no administrative intervention.

▲ **Perimeter Protection:** Our Gate Sentry makes your Internet facing mail systems invisible, providing protection from open-relay, Denial of Service (DoS), flooding, address harvesting, and many other attacks.

▲ **Delivery Manager:** Our Delivery Manager technology enhances the reliability of incoming email by eliminating all downstream link problems or application abnormalities – planned or unplanned. Whether your mail system is not functioning due to a maintenance routine or backup, we will automatically queue your mail and release it when normal mail functions are restored.

▲ **Control & Configuration:** Filter settings, capture rates, user and organization level quarantines are all under the direct control of the administrator through our tightly integrated web-based Management Console.

▲ **Reports & Stats:** Reports provide feedback on system performance including many statistics on held mail, top spam messages, top viruses, and top victims.

Isis only selects service providers who carefully select their data centers to meet the demands of a high availability, mission critical messaging system. Their three facilities, located in Texas, Virginia, and London, provide the built-in redundancy necessary for failsafe network operations. All their facilities have these features:

- ▲ **Conditioned UPS power (N+1 redundant).**
- ▲ **On-site generators that can run indefinitely should utility power fail.**
- ▲ **N+1 redundant HVAC systems.**
- ▲ **Advanced fire detection and suppression systems.**
- ▲ **Physical access secured using military-grade passcards and biometric hand scanners.**
- ▲ **Cisco GSR 12000 class routers running HSRP (N+1 hot failover) through six leading communications providers.**
- ▲ **Unique multi-tier DDoS mitigation engine.**
- ▲ **Continuous Network and Application monitoring.**
- ▲ **Certified onsite staff.**
- ▲ **100% Network availability.**
